Feedback

REQ #3:

The timeline should be scrollable up/down to show other entities.

The timeline should be scrollable from left to right (with time on the x-axis), where the time is increasing when scrolling to the right.

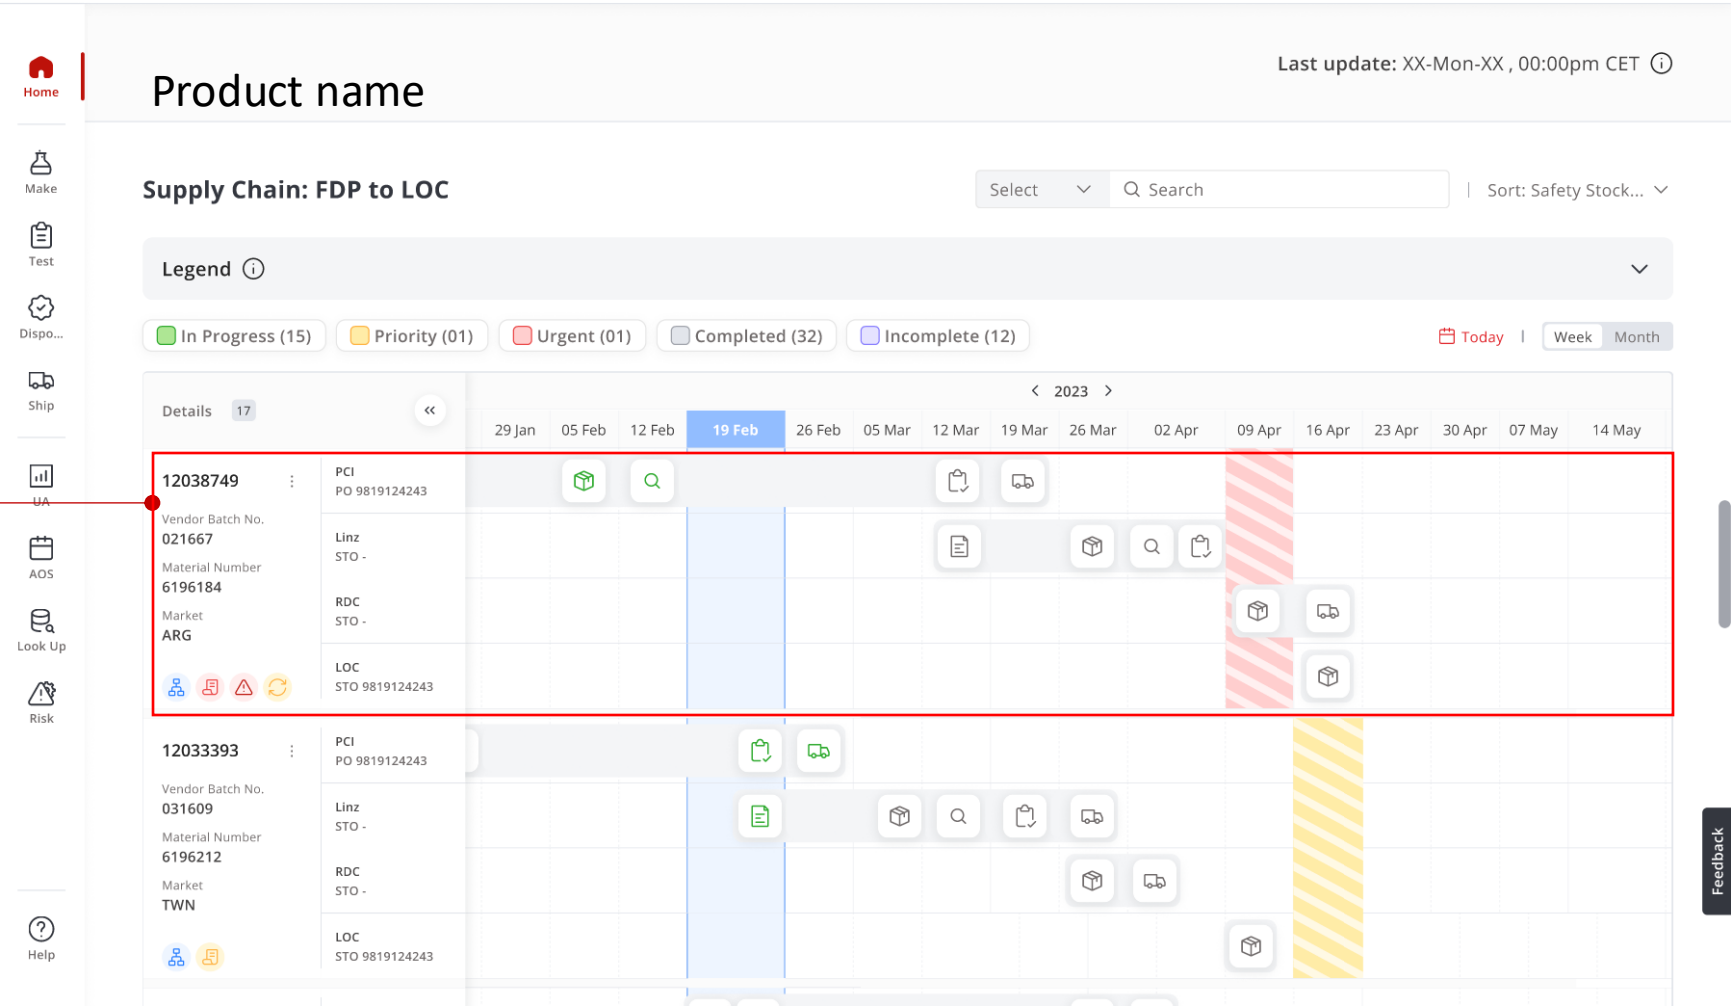

REQ #4:

The user should have the ability to configure the number of entities per page. One row (see rectangle) represents one entity.

Ideal scenario is 5-10 entity per page, but this is to be configured by the user specific to a product view.

Limitation #1

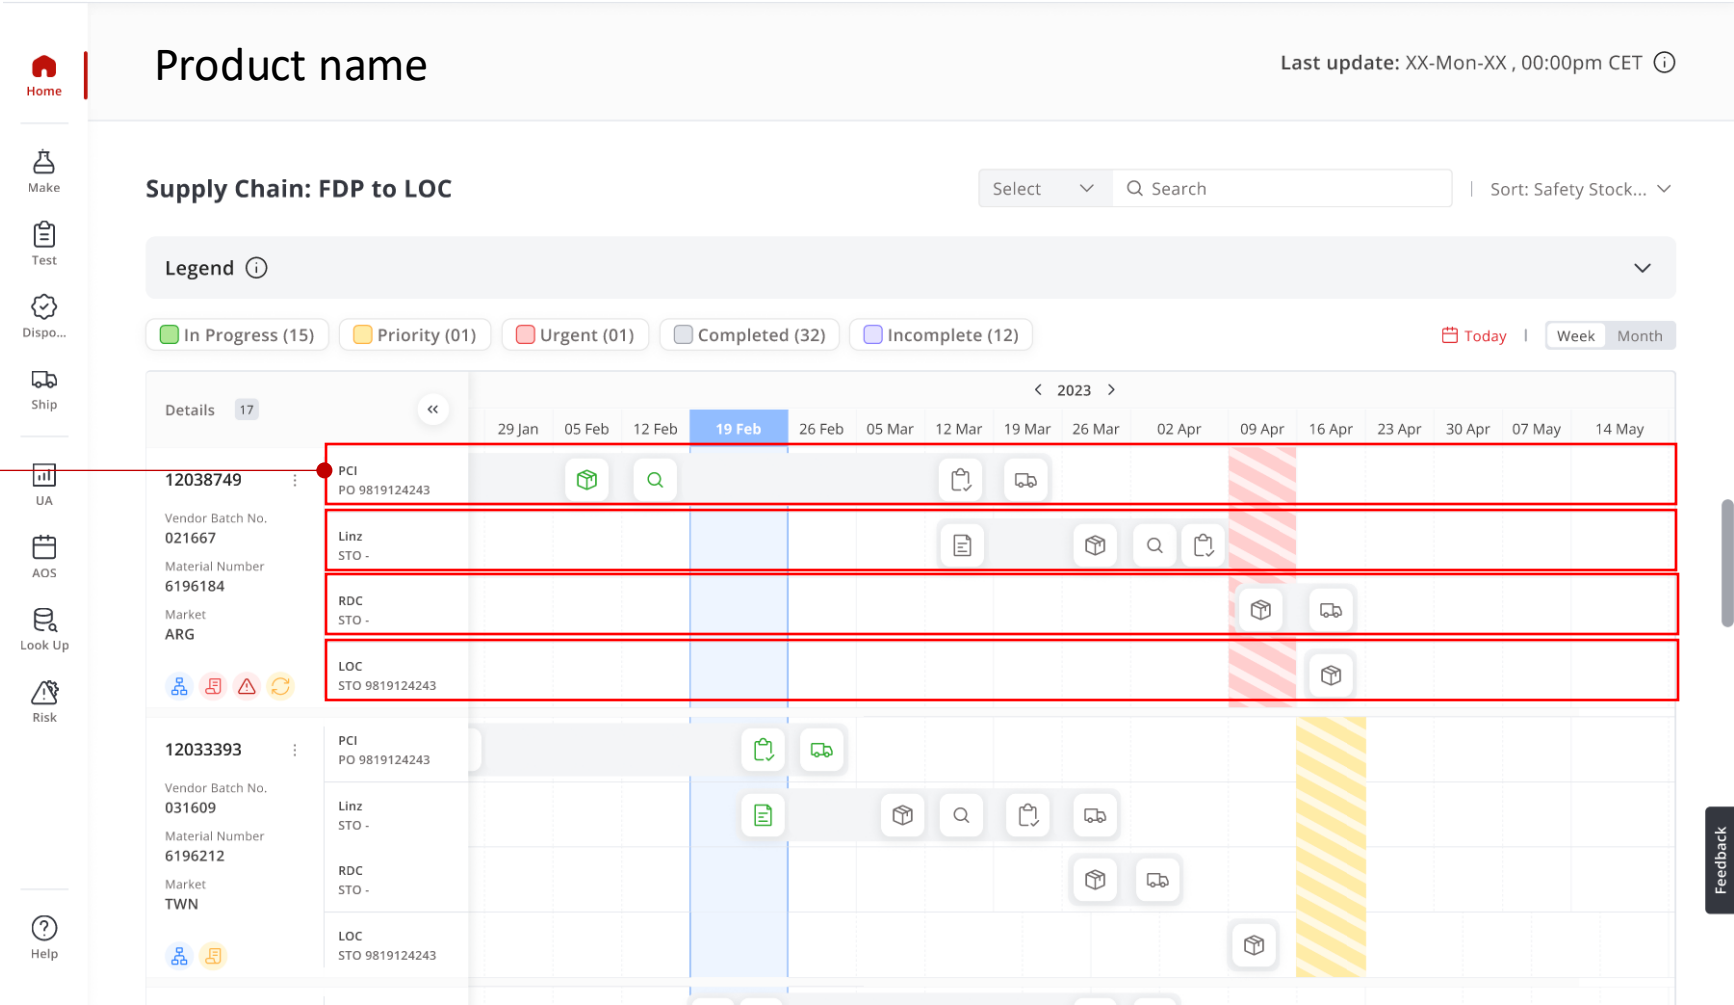

Cannot increase the number of entities per page to >3 due to the lack of dynamic column sizing

REQ #5:

The number of flows and their name per entity should be configurable, data-driven, or defined by the user. Here there are 4 flows. The configuration framework should allow a large range of flows per entity.

Page sizing should respond dynamically.

REQ #6:

Users should have the ability to configure quick filters (name and number of filters). Upon clicking on quick filters, they manipulate/sort/filter the entities below based on the entities' status.

The quick filters also show the count of entities for each category of the quick filter.

In case no quick filters exist, the user should be allowed to hide quick filters as per its configuration

REQ #6.1:

Creation of a common component out of the quick filters with the following filters created from the configuration/settings screen:

- 1.In Progress - POs with material theoretical delivery date >2 weeks before the date material will hit safety stock level - Status to be passed via API
 - 2.Priority - POs with material theoretical delivery date < 2 weeks before the date material will hit safety stock level - Status to be passed via API
 - 3.Urgent - POs with material theoretical delivery date the same as or after the date material will hit safety stock level (Default state) - Status to be passed via API
 - 4.Completed - When the material delivered at LOC != null and marked as completed - Status to be passed via API
 - 5.Incomplete - When the batches would not be completed and intentionally moved to this state - Status to be passed via API
- Note - And count of each should be the sum of the above logic for each filter which needs to be displayed on the quick filter.

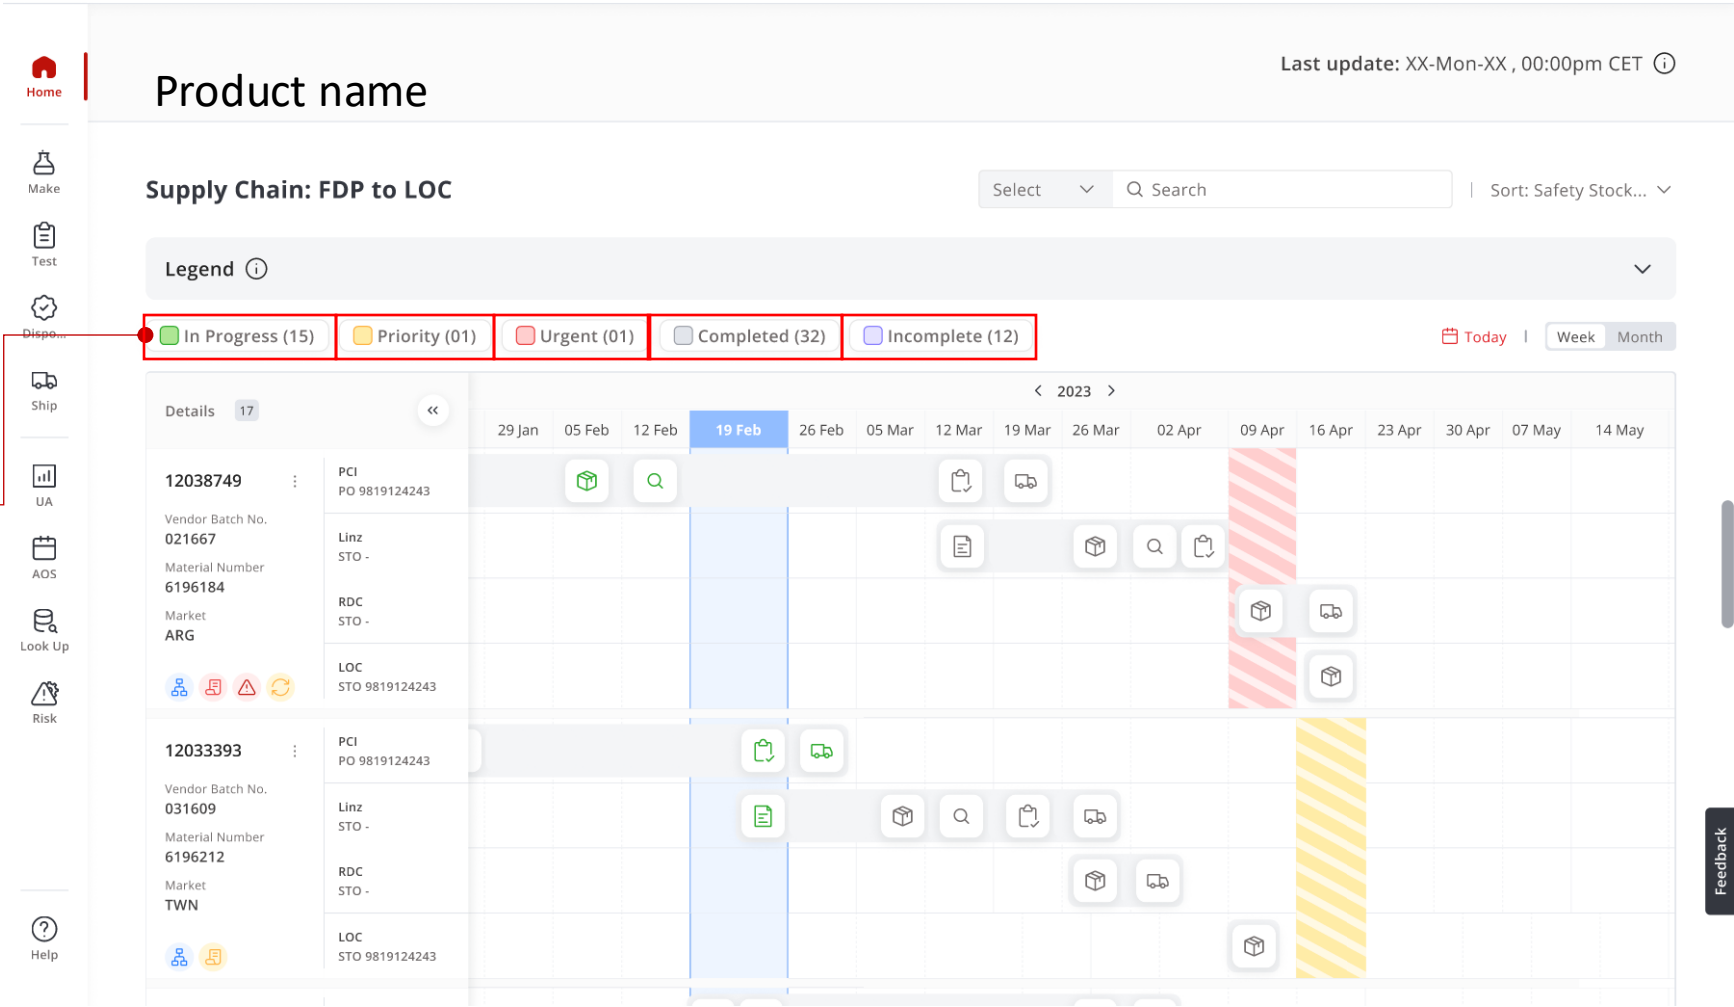

Scenario: Number of quick filters

Given I am a user on the Insight center application
When I navigate to the PO Adherence page from the Brands page
Then I should be able to see minimum 5 quick filters and 6 quick filters at max in a single row as per the latest common component design with the text and count on each filter.

Scenario: Quick Filter Selection

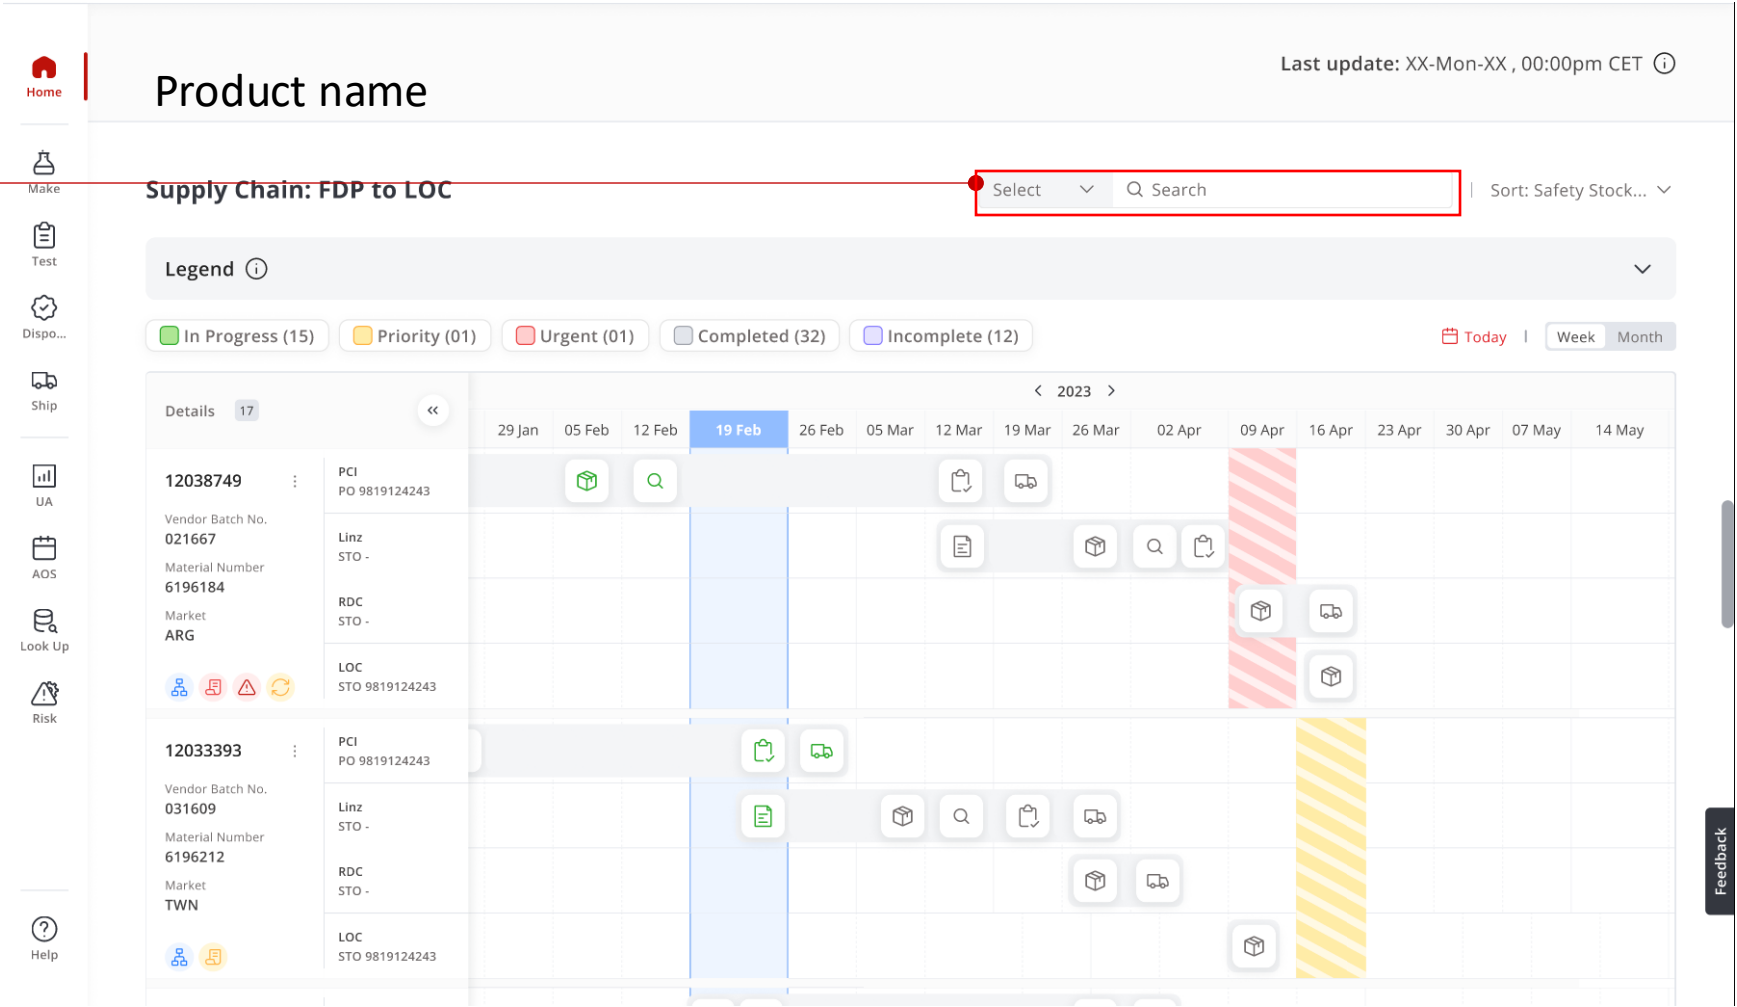

Given I am a user on the Insight Center application
When I navigate to the PO Adherence page from the Brands page, then I should see Urgent Filter selected by default with its records displaying, and at any given time only one quick filter should be selected.
And selecting any other filter should deselect the previous one and update the records on the page

In case no quick filters exist, the user should be allowed to hide quick filters as per its configuration.
The user should also be able to add additional filters from the configuration/settings page that fit the above criteria.

Users should have the ability to search for an entity based on a wild-card search.

Results can be unique or multiples.
Timeline page should respond
accordingly to the number of resulting
elements.

REQ #8:

Users should have the ability to sort the entities based on a set of configurable variables (ex: entity number, vendor batch number, material number, market, PO #, flow , etc...). These elements are part of the incoming data table or comprised within the metadata.

This should be specified within the configuration/settings page.

REQ #9:

User should have the ability to see when the data was refreshed from source tables. The CET timestamp will be served by an API.

The time zone should be specific to the user or be configurable from the user’s choice. Multiple options for time zones should be present. A hover over option should present 1-2 alternate time zones.

REQ #10:
The user should have the ability to collapse/open the legend.

The user should be able to hide the legend if there are no fields within the legend

CONFIGURABLE

EXTRA ELEMENT TO ADD TO CC LIBRARY

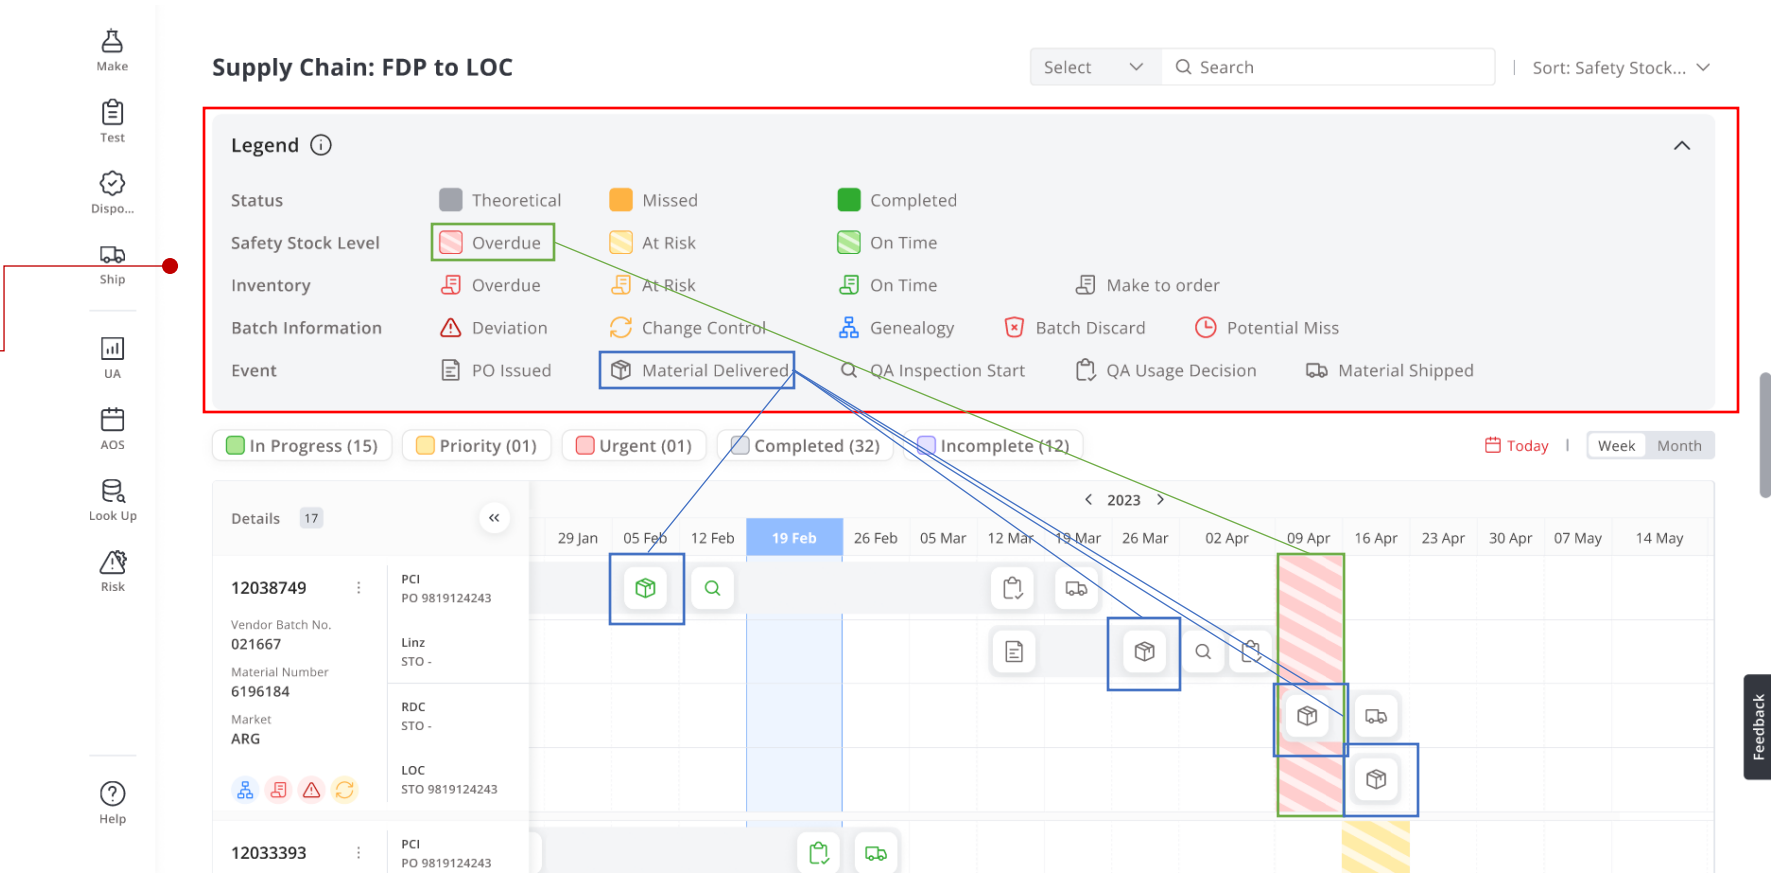

REQ #11:

Creation of a dynamic common component out of global legend created from the configuration/settings screen:
Automatically generate a legend based on the items and events that are part of the timeline view/on page.

The legend should update dynamically as new items/events are added or removed from the timeline.
Colors used to represent different event types or statuses should be reflected in the legend.
Each item in the legend should have a clear label and be visually distinguishable.

Acceptance Criteria:

A dynamic legend is displayed alongside or below the timeline.
The legend updates in real-time based on the contents of the timeline.
Each event/item in the timeline is represented in the legend, along with its corresponding color and label.

REQ #12:

The user should be able to define (configure) the contents of the legend, where the legend has several rows and icons (with colours) associated with every row

Feedback

REQ #13:

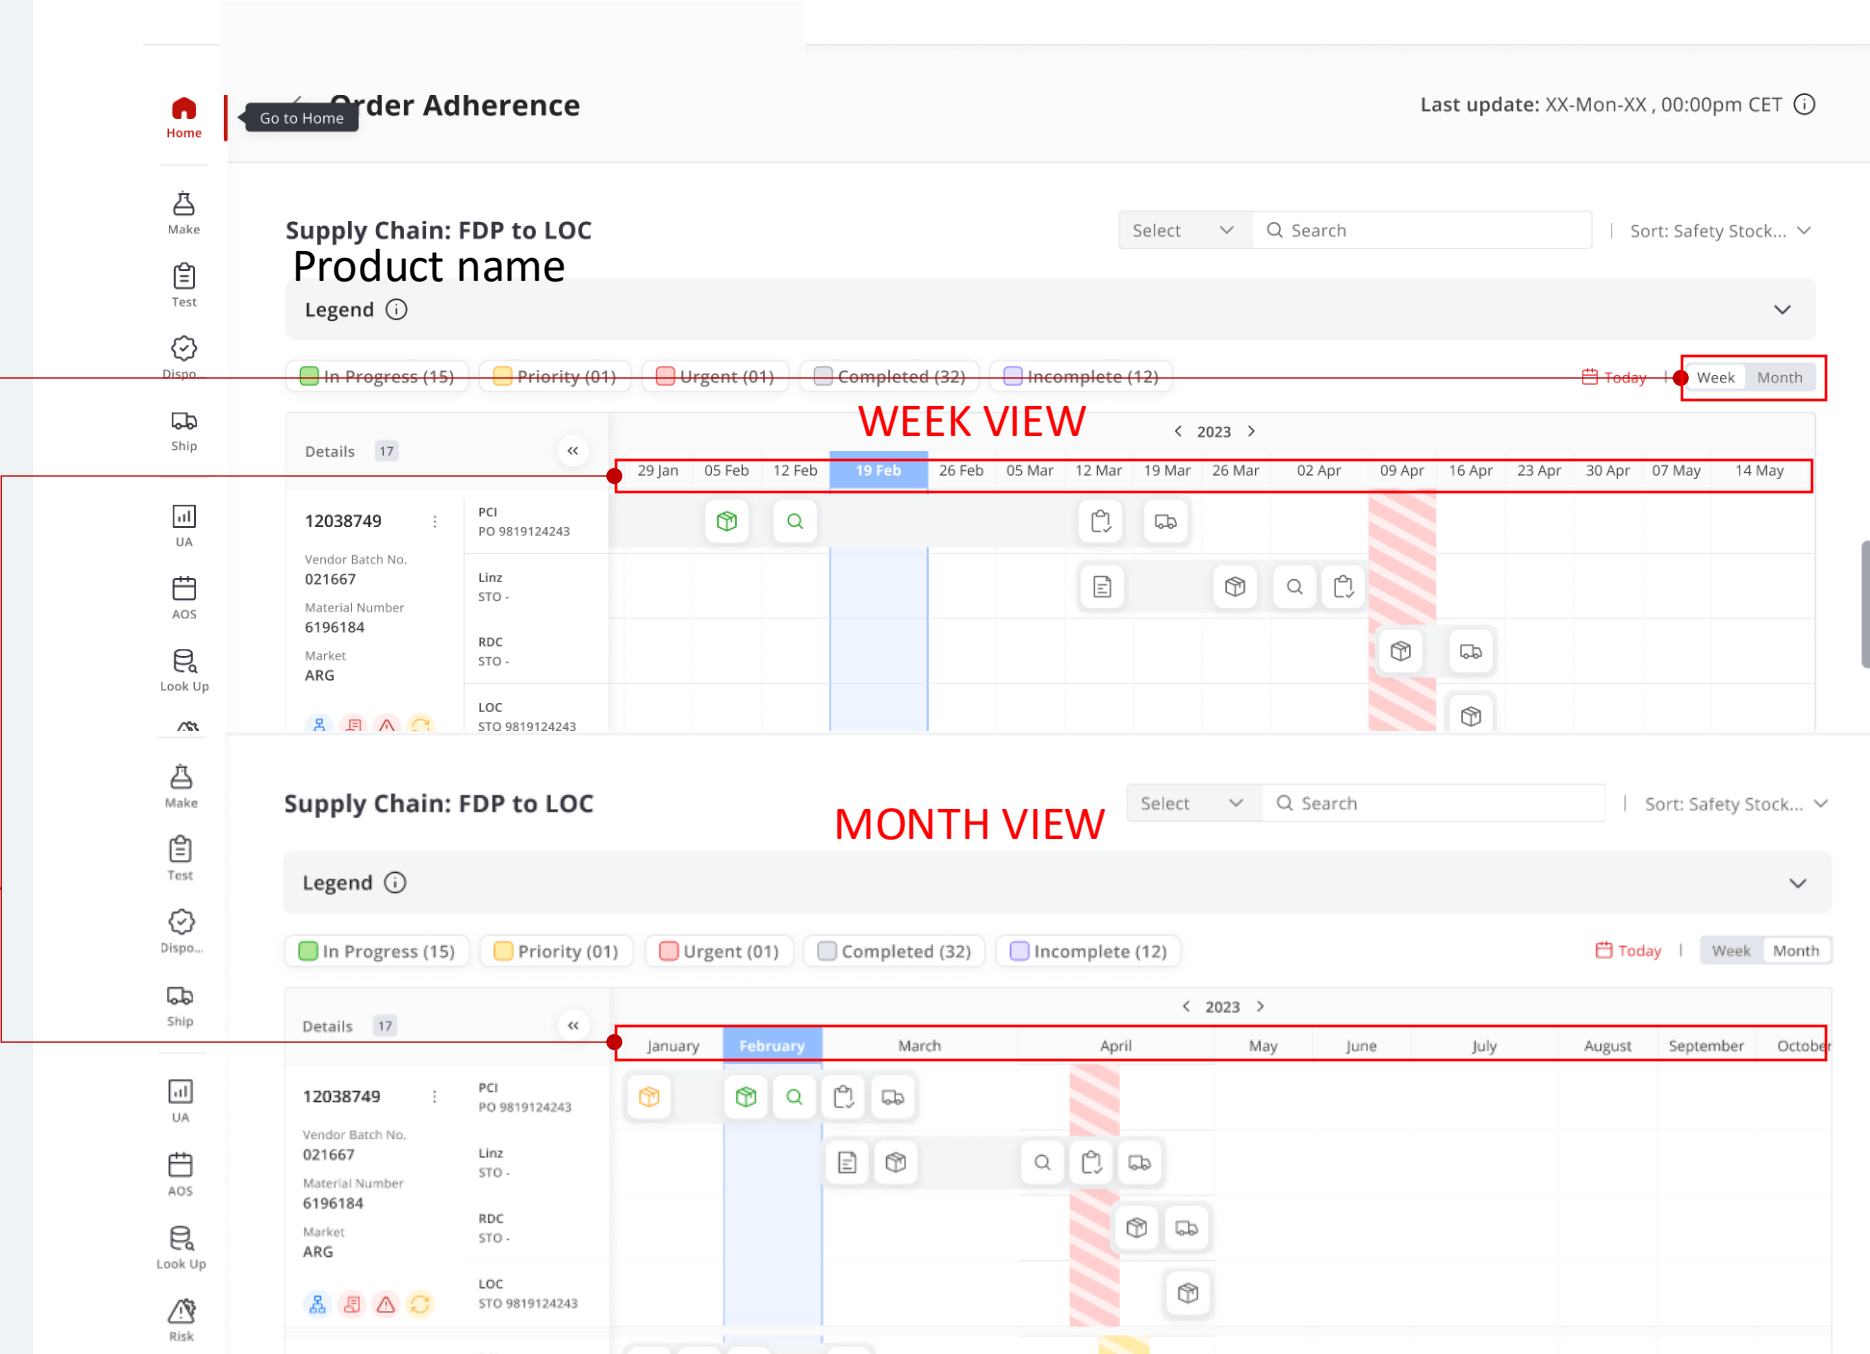

The user should have the ability to toggle between different levels of granularity: hours, days, weeks, months, and years.

The user should have the ability to define, the different levels the toggle contains, i.e., hours|days|weeks or hours|days or week|month etc..

(The different levels of granularity should be identical in terms of UI. The only difference is the change in the unit of the calendar which would aggregate the symbols within every row, see for week view and month view)

There is no direct link between the header unit selection and the week/month toggle in the upper right.

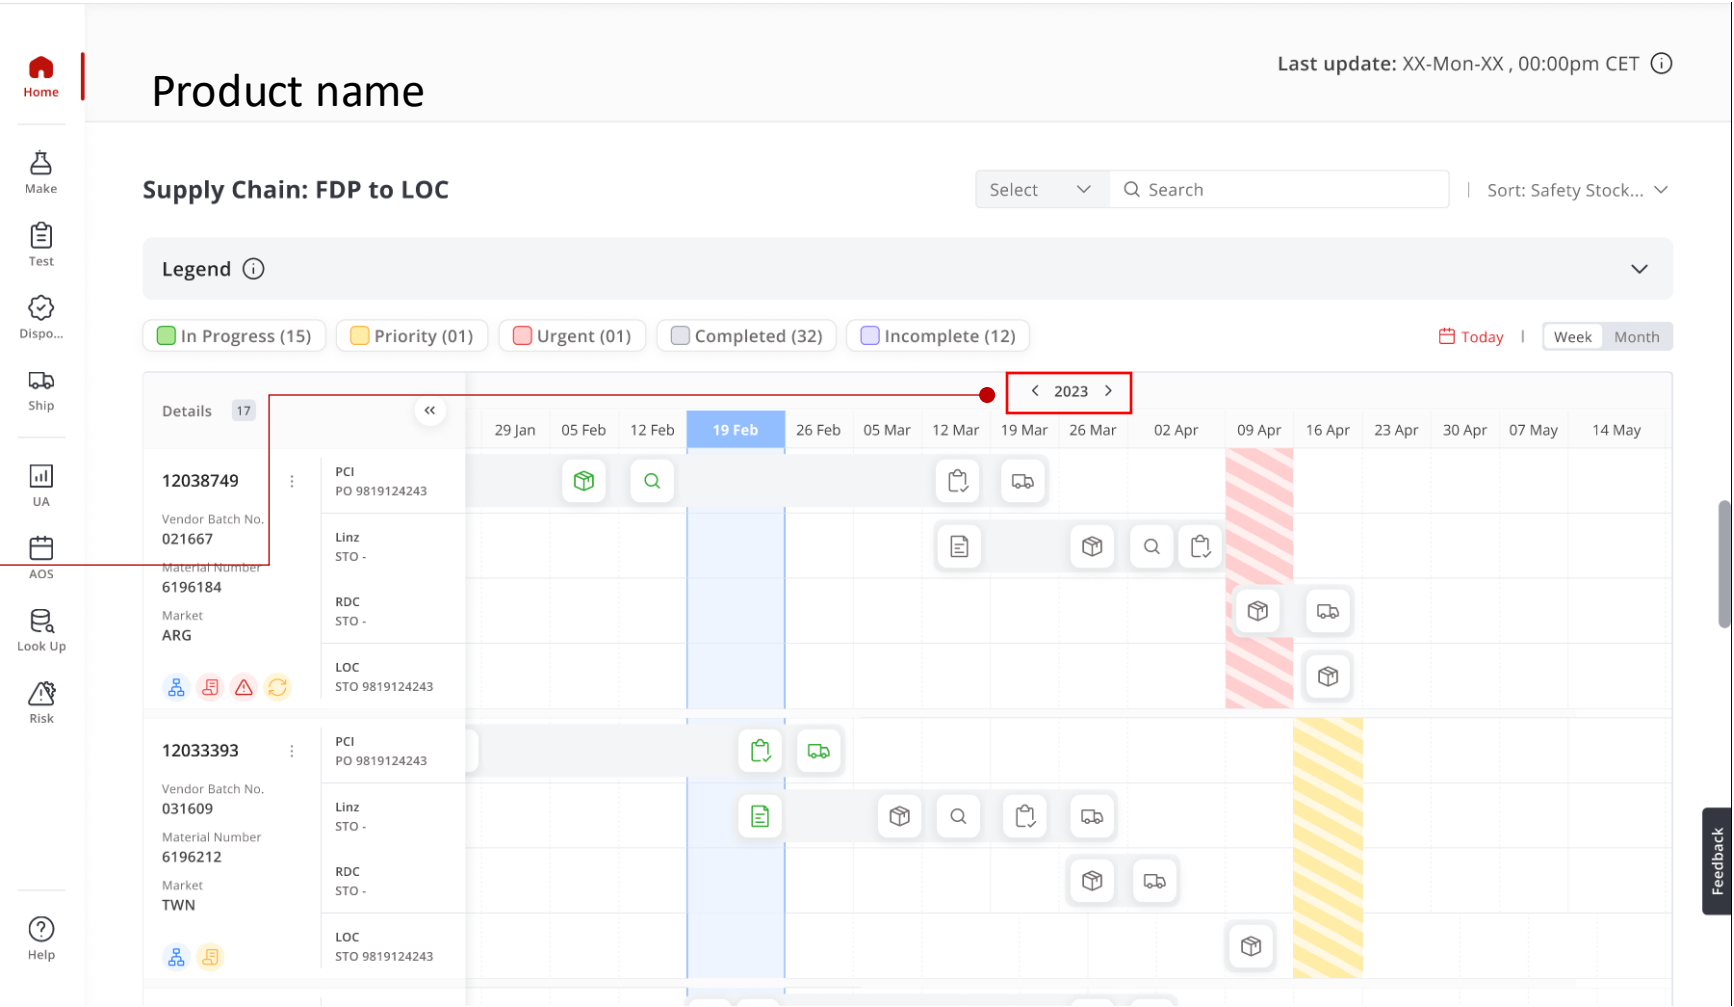

The header selection specifies the incoming data (i.e. data from this many weeks, months, quarters, years etc...) the week/month toggle specifies the unit/view of the timeline.

REQ #14:

The User should have the ability to move between a configurable unit of time (shifts the timeline view by a specific unit of time to the left or right). Either hours, days, weeks, months, quarters, years, etc...

The header should reflect what the time of the current view is about (for example unit of time = year, year = 2023. If the user scrolls to the right year = 2024, if the user scrolls to the left = 2022). Same applies for other units of time that can be configured.

CONFIGURABLE

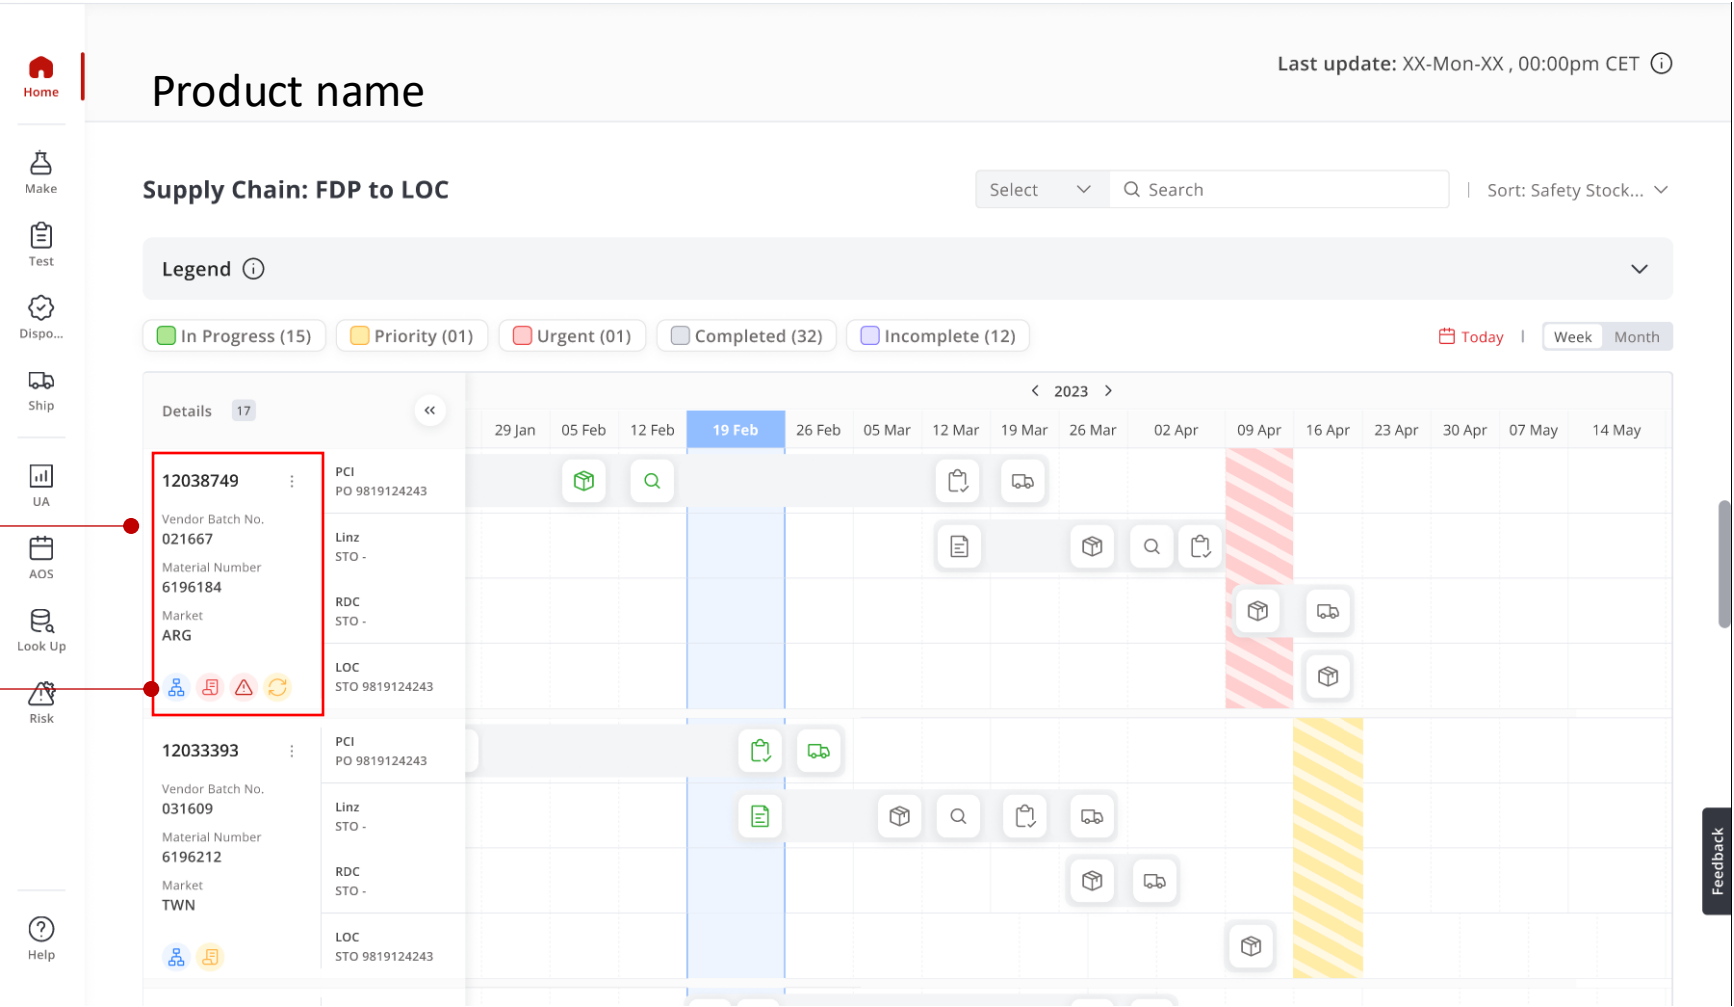

REQ #15:

The contents of the entity cards (rectangle) should be configurable by the user.

REQ #16:

Various buttons/traffic lights should be shown in the entity card-based on configurable parameters.

For example: if x is present in the column, turn the icon blue and allow The icon to be clickable to open a Popup or bring you to a specific view (bookmark view as in specific moment in time etc...). These bookmarks/pages are present in the flyout slide requirement below.

REQ #15.1:

Acceptance Criteria

Scenario: Details Card (default state):

As a user I should be able to view the following fields on the batch details card as per the design:

- 1.SAP Batch Number
- 2.Vendor Batch number
- 3.Material number
- 4.Market
- 5.Batch traffic light icons for presence of Genealogy, trackwise, plant details and safety stock (presence or absence)
- 6.Sites and PO numbers for Sites
- 7.Total number of batches on the details header
- 8.A collapse button

The elements on this card are to be configured on the configuration/setting page as per the user’s requirements.

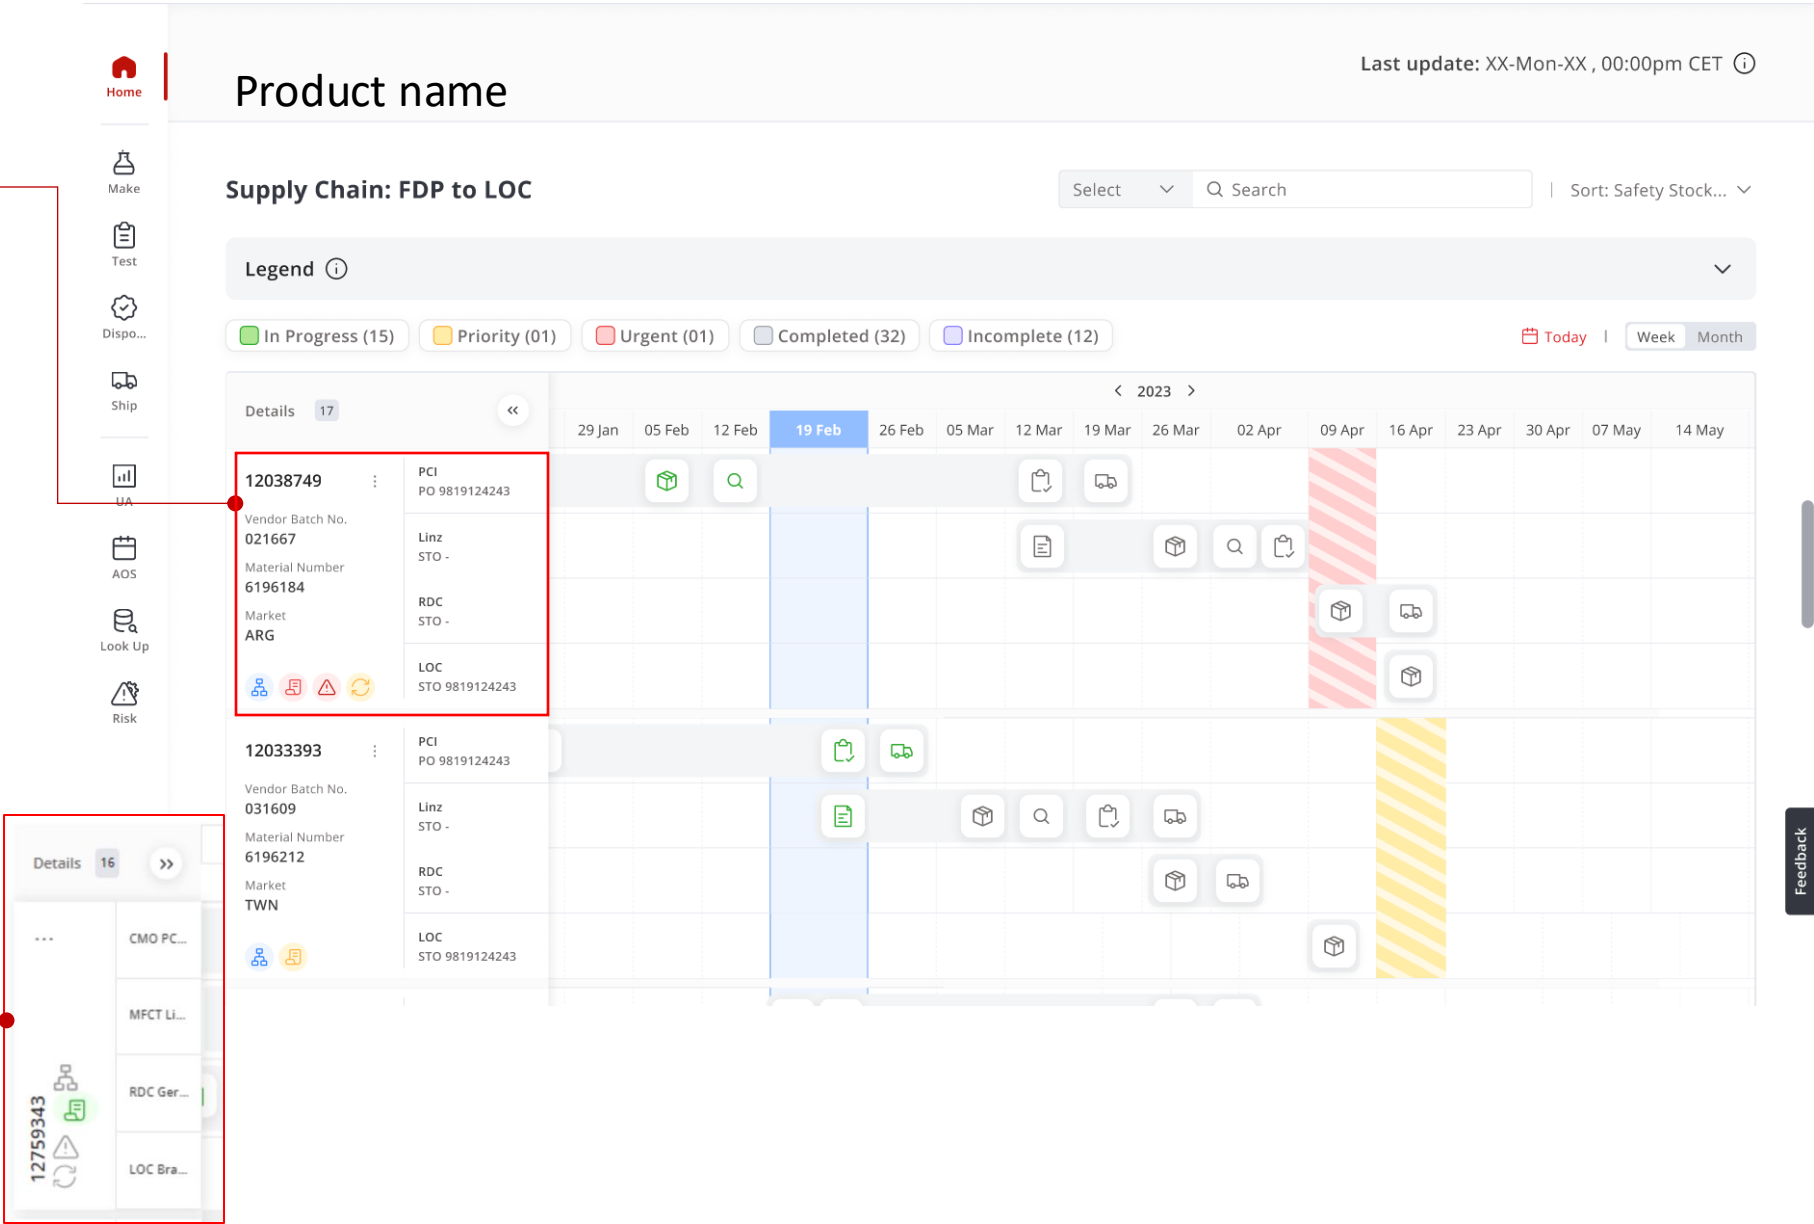

Scenario - Collapsed State

Given I am a user on the PO adherence page, when I am viewing the batch details card in its default state and click on the collapse button, then I should see the batch details card in its collapsed state as per the following -

- 1. Plant names and their PO number
- 2. SAP batch no and batch traffic light icons on the side (properly aligned)

Scenario - Maximum and Minimum Plants on a batch card

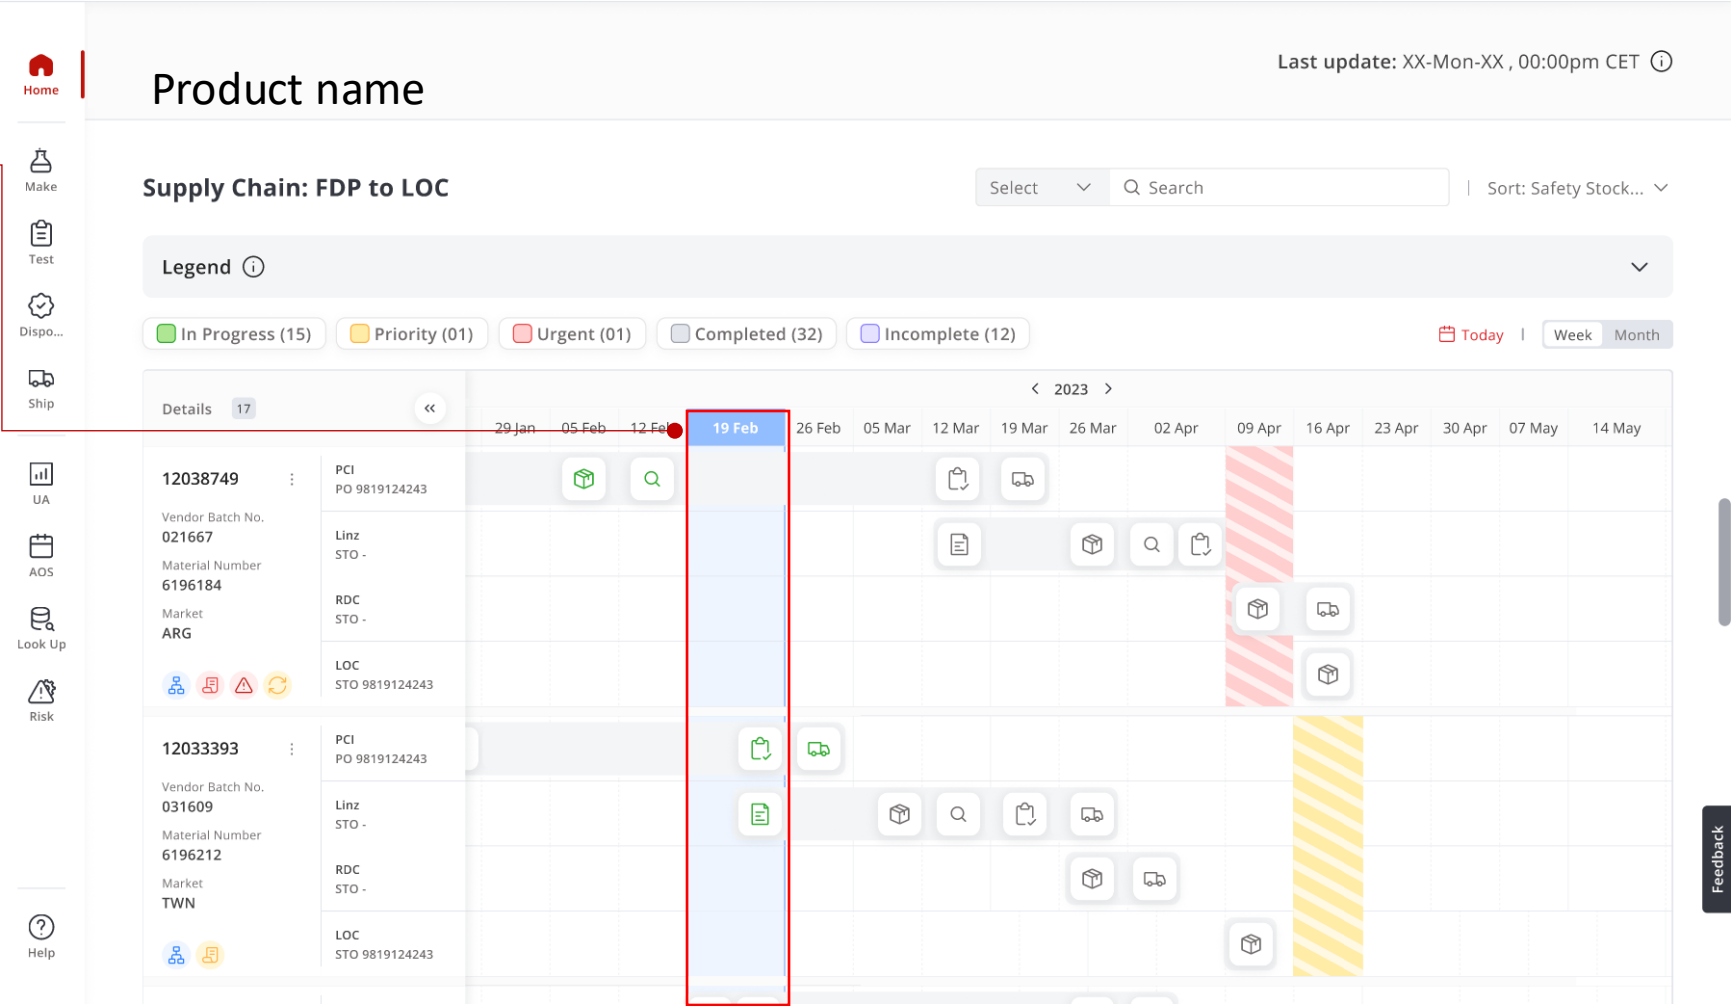

Given I am a user on the PO Adherence page
When I am viewing the batch details card
Then the batch details card should be in such a manner that it is dynamic and can have 6 plants at max and 3 plants minimum.
And the batch details card should adjust its height as per the following designs.

REQ #17:

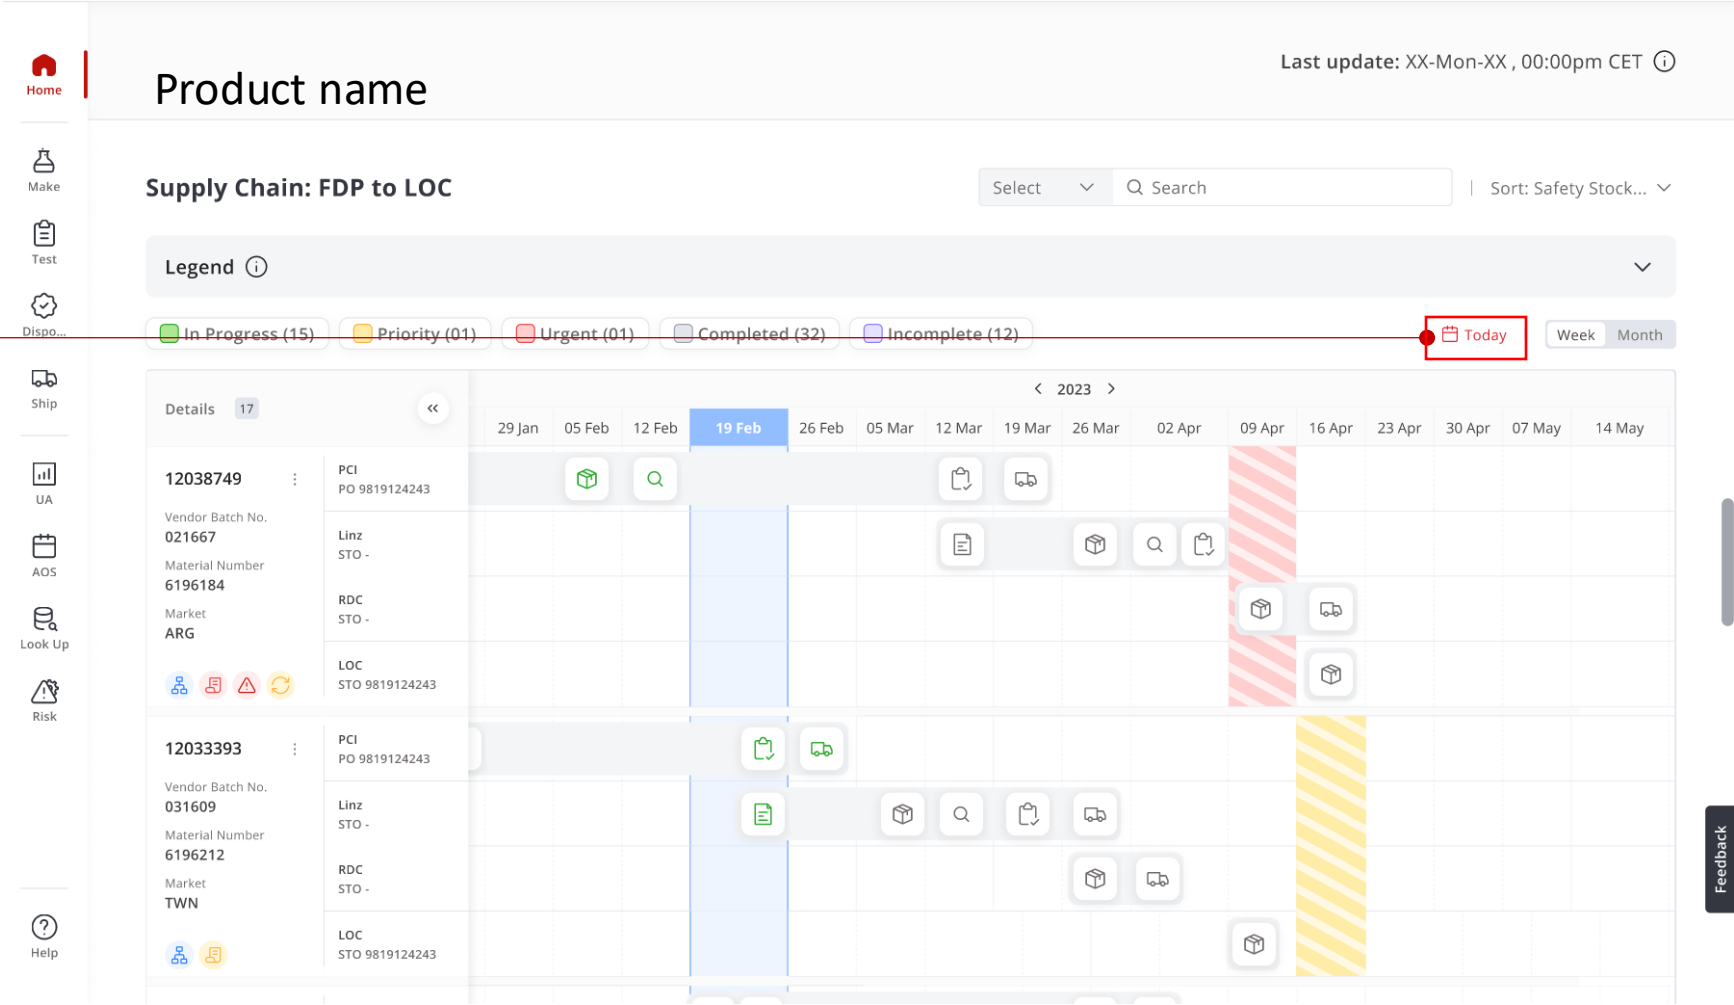

The current unit of time (hour, day, week, month, quarter, or year) that was chosen by the user should be highlighted.

This should be dynamic and progress with time. As in, next month, the current month will be colored etc...

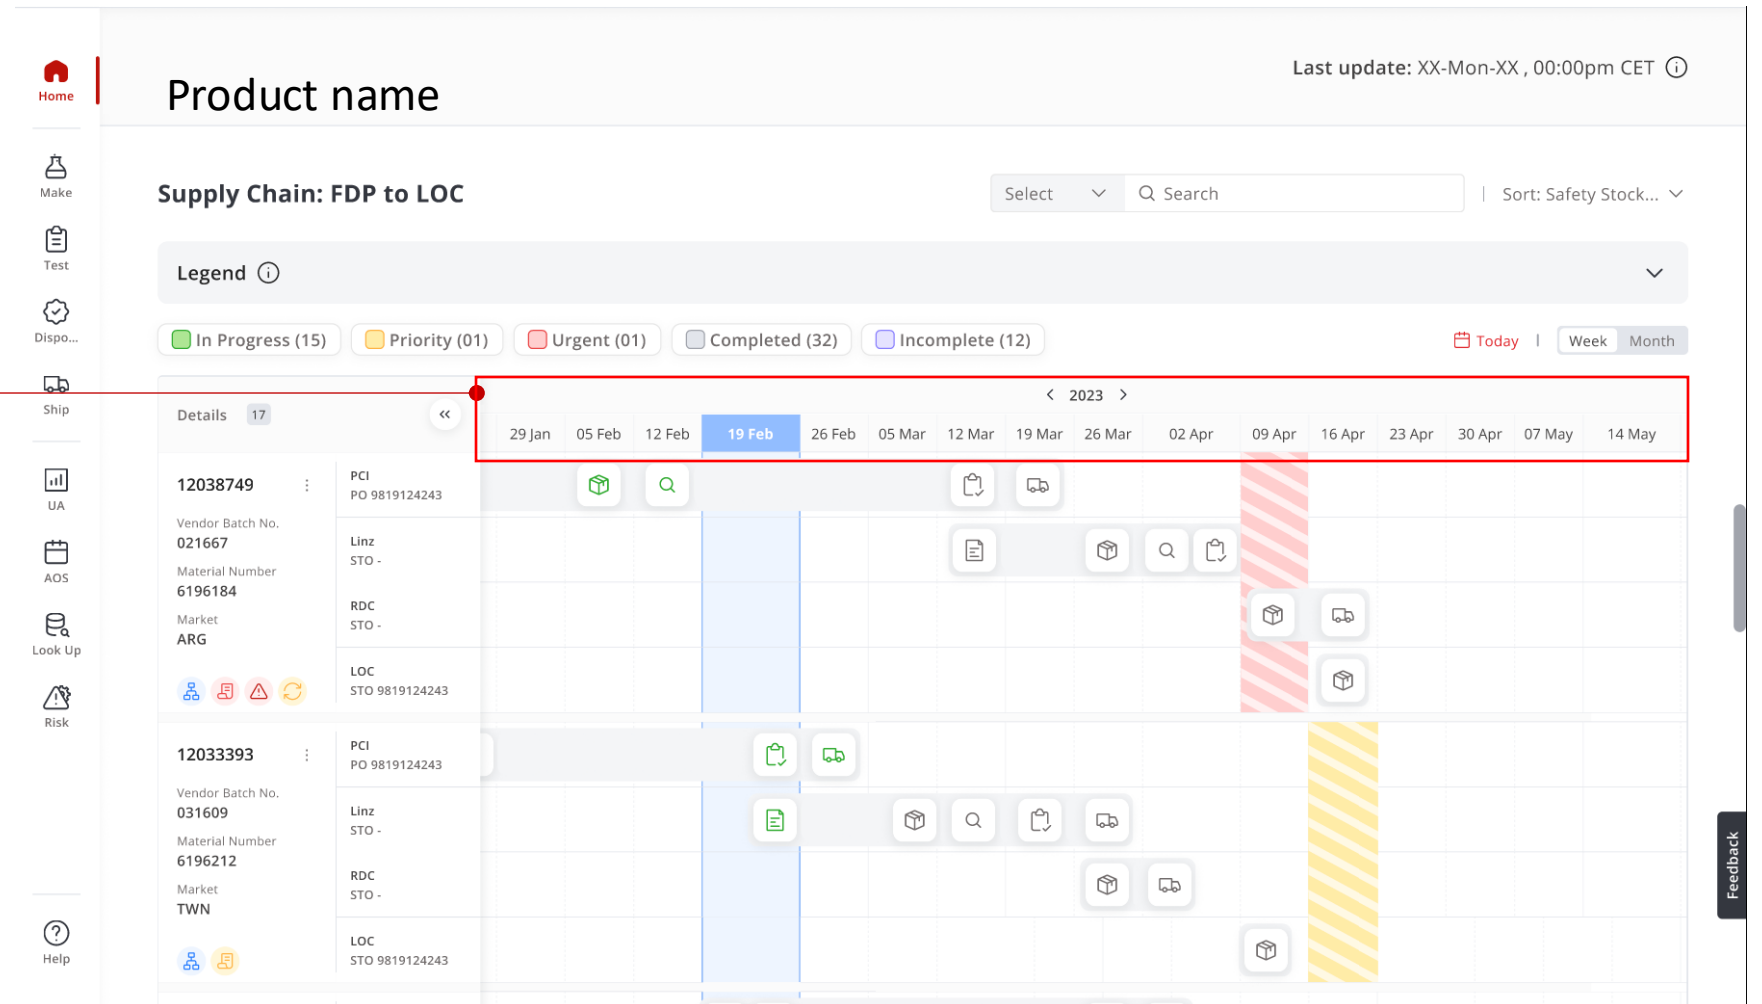

REQ #18:

When the Today button is clicked, the user should be brought back to the current view off-centered.

Limitation #2

The header of the table should be sticky and stay when the user scrolls up/down. Toggle on/off is available for this sticky header.

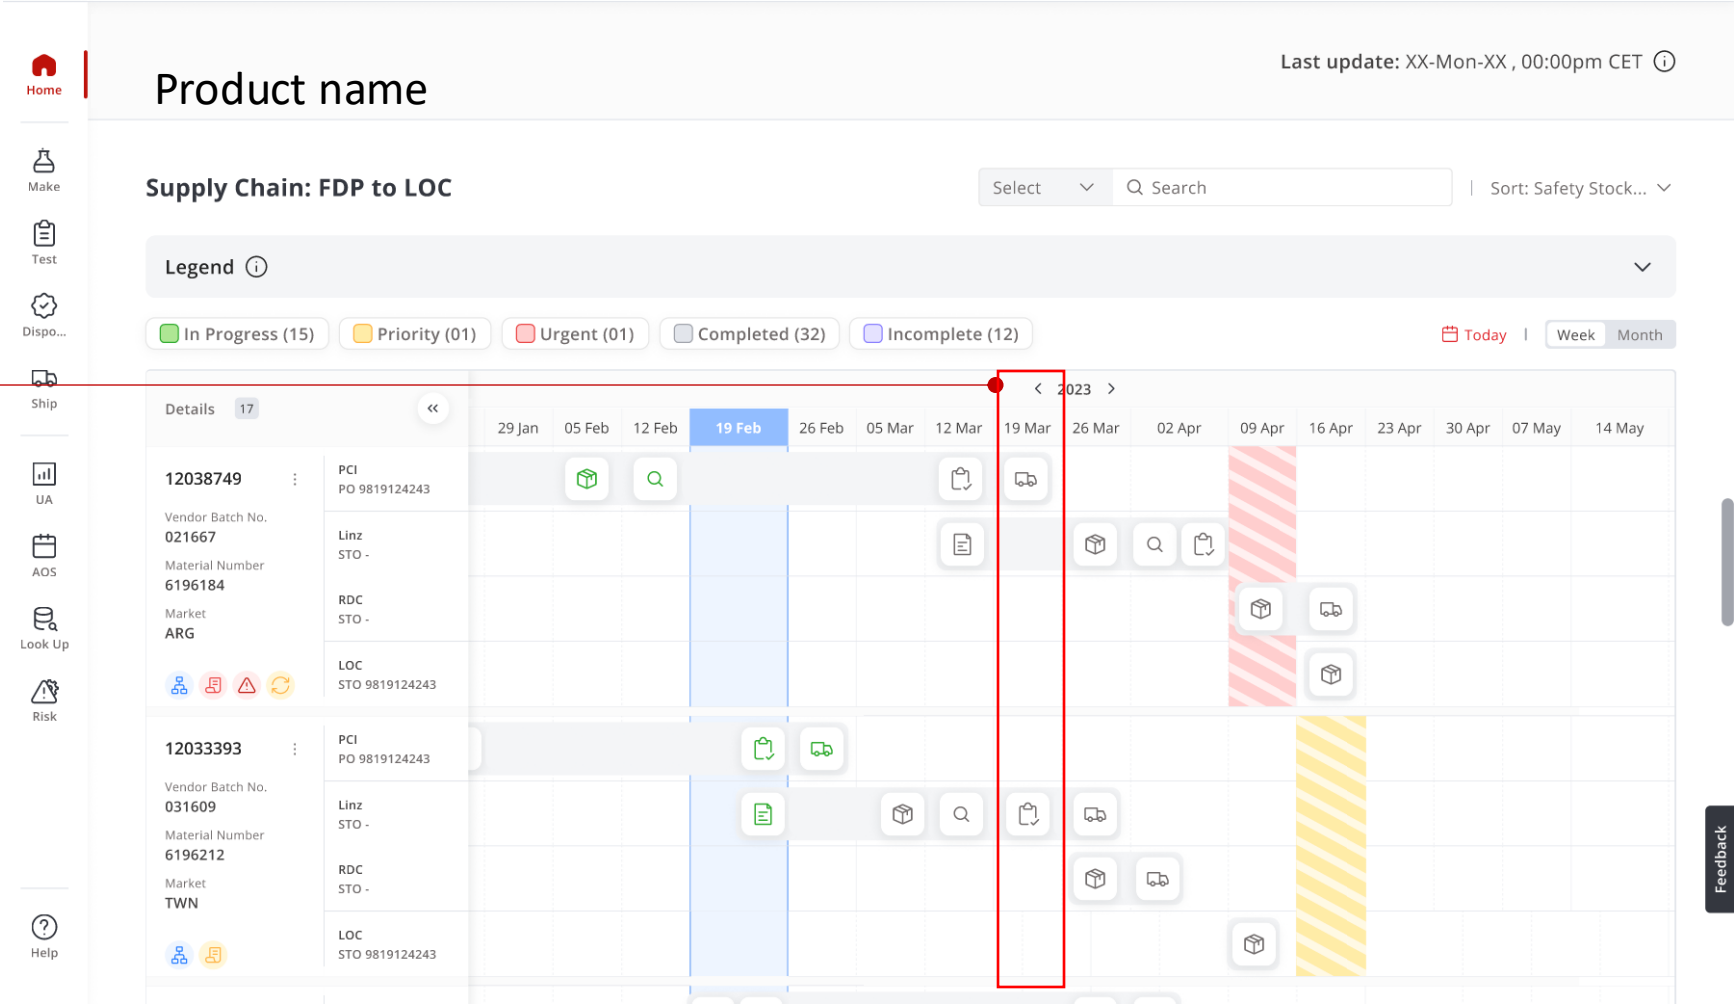

REQ #20:

Limitation #3

The columns of the table should be dynamic in size and should be tight around the number of events contained in each column.

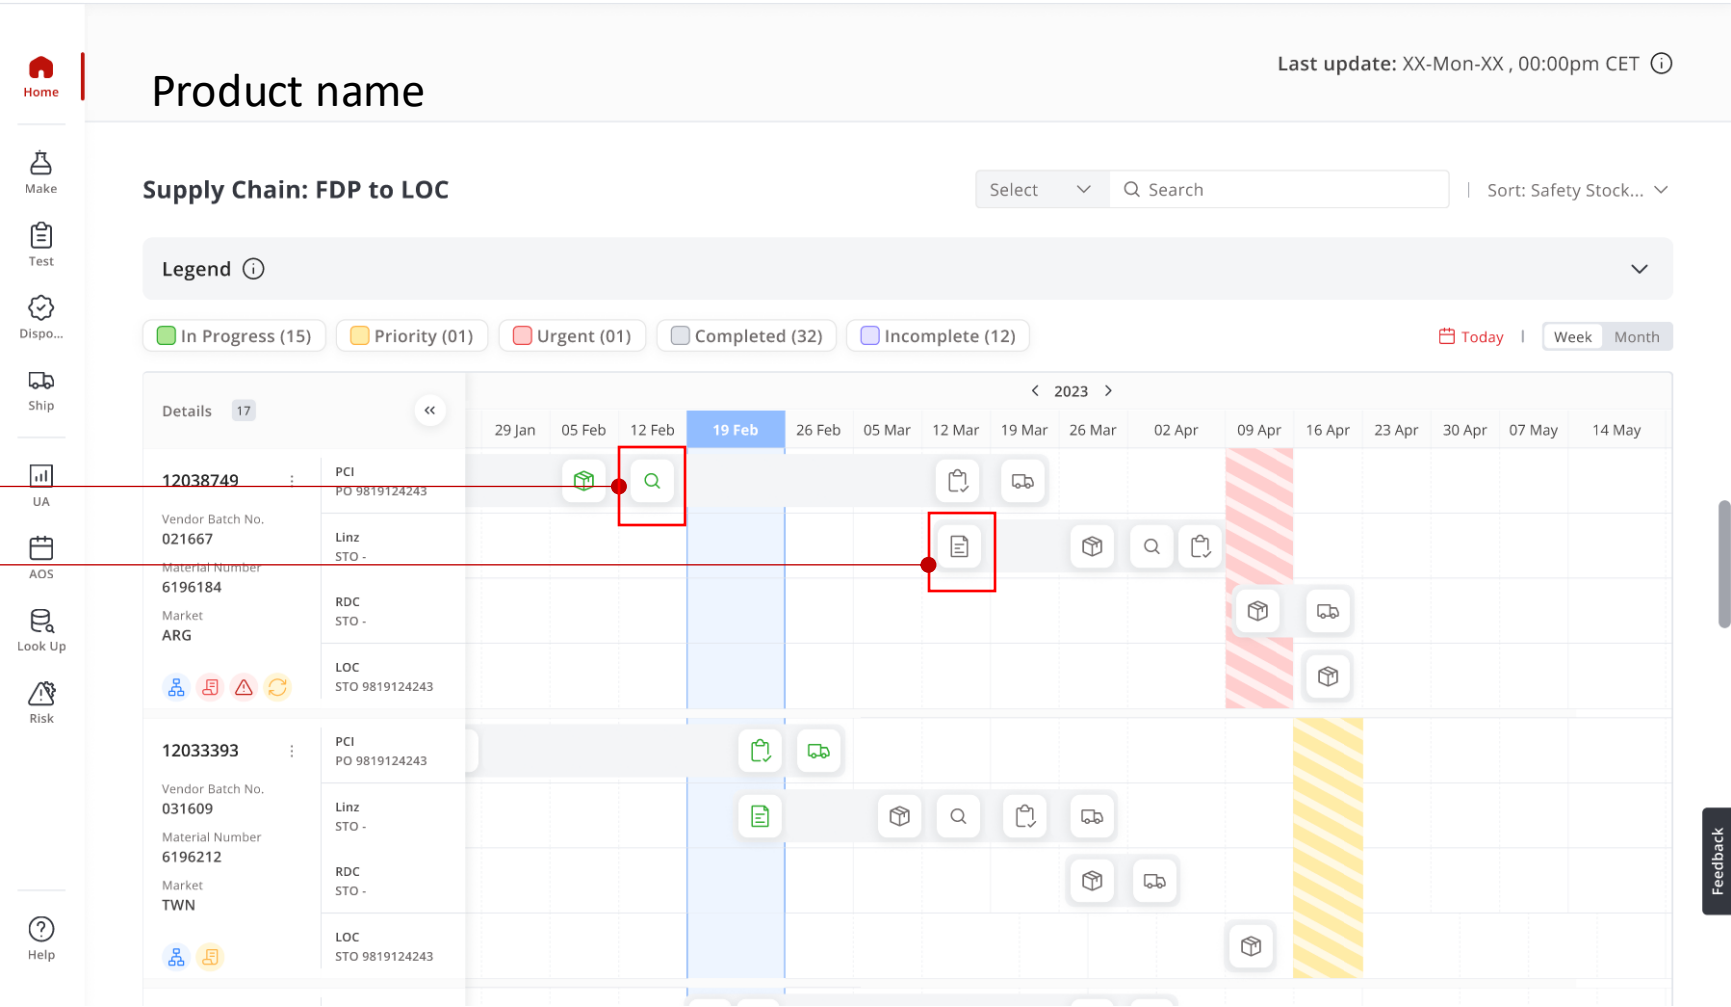

The entire timeline view should maximize the number of columns it shows to the user, while maintaining proper visibility/user experience.

REQ #21:

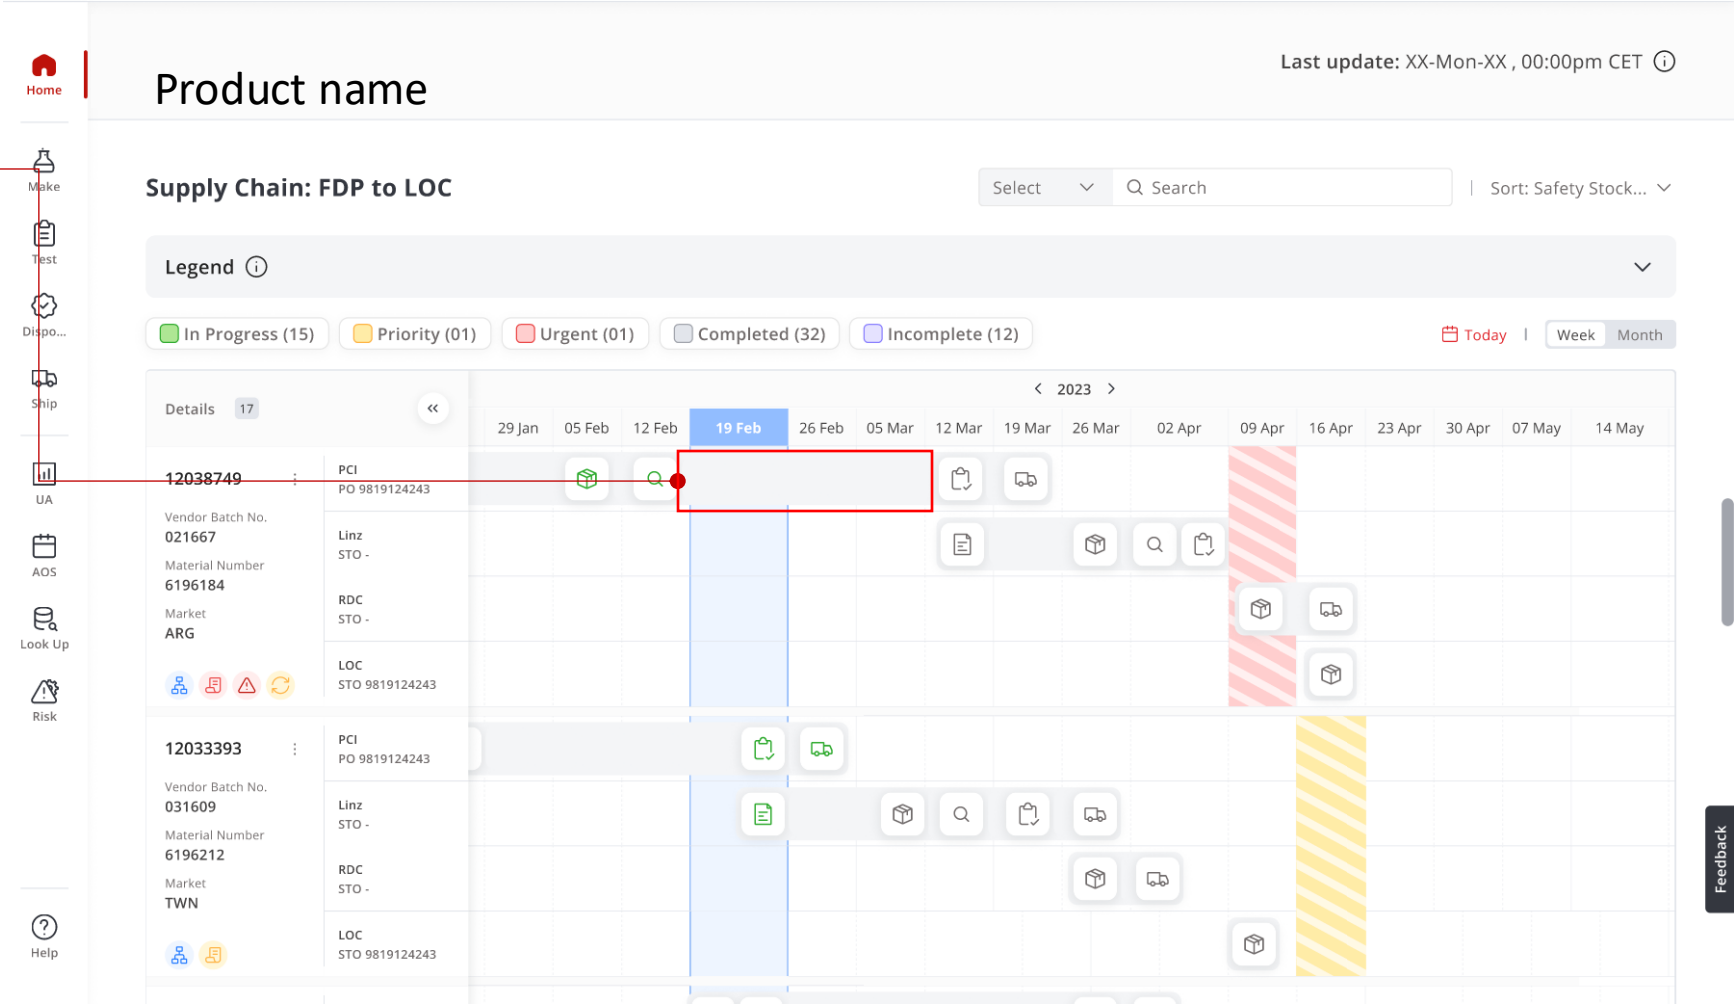

Different icons are used to represent different activities within the process of a specific entity. Clicking on an icon either opens a popup or re-directs the user to another page (as per the users' configuration).

Icons should be able to hold different states/colors based on logic (for example, grey is theoretical, green is early, yellow is past, red is critical etc..). The selection of these icons and their coloring logic comes from one of the API events.

REQ #22:

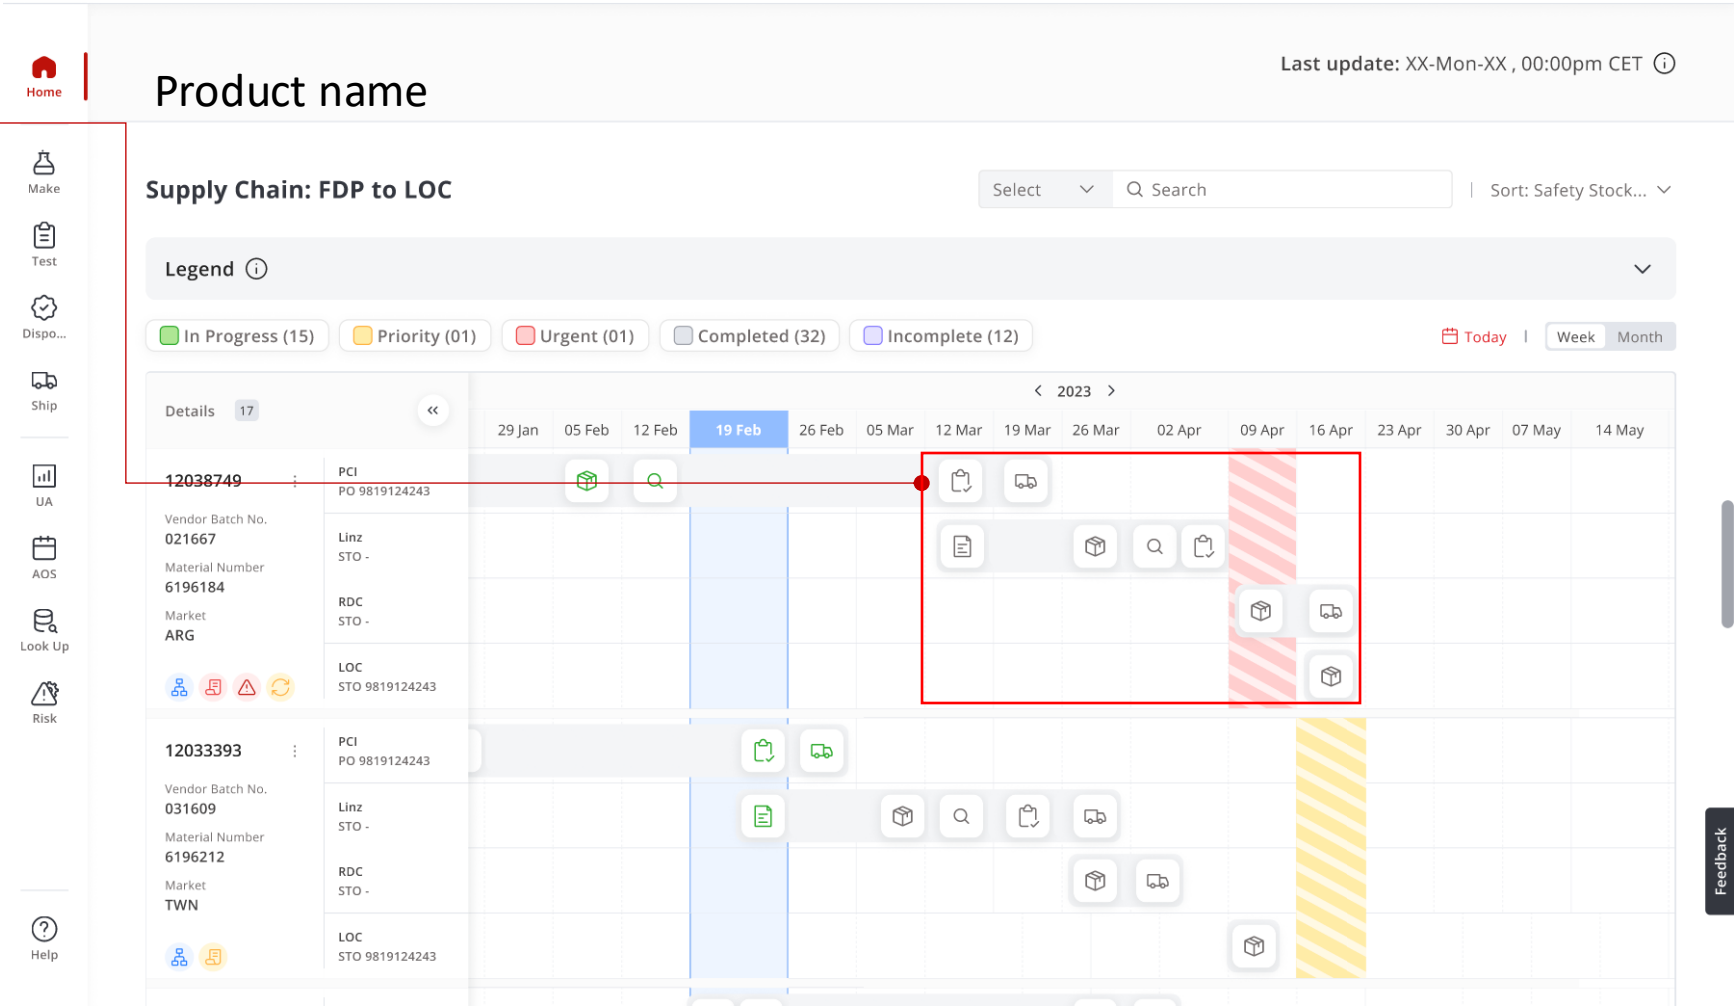

All the icons within a row (from the first icon to the last) should be connected by a grey banner that is dynamic and self-adjusting.

REQ #23:

The events should change their colour (grey, green, amber, red or others) given a pre-defined logic.

The banner (red hash) should change their colour (red, yellow, green, gray) given a pre-defined logic.

REQ #24:

When the ellipsis next to the entity number is clicked. A drop down is opened below.

When you click outside of this dropdown, the drop down should automatically close.

Move batch status

Done

REQ #31:

The user should be allowed to change the status of a batch (in case the status of a batch is not defined by data coming from a system but manually)

The quick filters should respond accordingly when a batch is moved (i.e. remove from one quick filter total and add to another quick filter total if the quick filter condition is met).

SUMMARY OF LIMITATIONS

Limitation #1

Dynamic column sizing

To see more than 3 entities per screen and see the maximum number of weeks on the timeline view (without scrolling) columns have to adjust dynamically in size and should be "tight" around the number of events.

Limitation #2

Sticky Header & Footer

The timeline header (year selector, date header) & Footer (pagination/scroll) need to be sticky on the page so that the user is aware of their current location in time and has controls easily accessible.

Limitation #3

Dynamic Target Banner

When the user switches between different time views (weeks to years) and back, the Target Banner / Safety Stock Banner needs to dynamically adjust and fit within the column.

Limitation #4

Framework

The current framework (Highcharts) is not able to scale to more use cases and customer support is lacking.
